

Plate Boundaries Card Sort

convergent	Areas where plates move toward each other and collide, causing uplift.	
divergent	Areas where plates move away from each other, forming either mid oceanic ridges or rift valleys.	
transform	Areas where two plates grind past each other resulting in faults such as the San Andreas. Earthquakes often occur at fault lines.	
subduction zone	Convergent boundary where an oceanic plate is pushed beneath a continental plate forming a trench. The oceanic crust melts resulting in the formation of volcanoes.
